QP: 25901720

MAHATMA GANDHI UNIVERSITY, KOTTAYAM

MG-UGP (HONOURS) REGULAR/REAPPEARANCE/MERCY CHANCE

EXAMINATION, APRIL 2026

SECOND SEMESTER

Multi-Disciplinary Course (MDC) – MG2MDCJMC100 – AI AND MEDIA

2024 Admission Onwards

Time: 1 Hour 30 Minutes Maximum Marks: 50

Part A

Multiple Choice Questions

Answer all questions.

*Each question carries **1** mark.*

1. Ensuring AI can understand emotions and complex decision-making
2. Augmented Intelligence enhances human decision-making, while AI operates independently
3. AI can be used to track personal information without consent
4. Virtual assistants like Siri and Alexa
5. AI enables precise ad targeting based on user behavior
6. Improved public trust
7. By removing background noise and improving clarity
8. Grammarly
9. AI-generated voices can sometimes lack natural emotion
10. Generating captions and subtitles
11. Summarizing and assisting in research
12. Identifying named entities in text, such as names and locations
13. Relying entirely on automation
14. Krisp
15. To generate accurate, context-aware text

(1x15=15)

Part B

*Answer any **5** questions.*

*Each question carries **3** marks.*

16. The development of virtual assistants was made possible by key AI breakthroughs such as Natural Language Processing (NLP), which allows machines to understand and respond to human language. Machine Learning (ML) enables assistants to learn from user interactions and improve over time. Speech recognition converts spoken words into text, while speech synthesis generates human-like responses. Advances in cloud computing allow fast data processing and storage. Additionally, improvements in deep learning and large datasets have enhanced accuracy and contextual understanding, making virtual assistants like Siri and Alexa more efficient and user-friendly.
17. AI plays a crucial role in fraud detection by analyzing large volumes of transaction data in real time. Machine learning algorithms identify unusual patterns, such as sudden large withdrawals or transactions from unfamiliar locations. AI systems can flag suspicious activities and alert banks immediately. It also uses behavioral analysis to study customer spending habits and detect anomalies. Additionally, AI improves over time by learning from past fraud cases. This helps reduce false positives and enhances accuracy. Overall, AI strengthens security, minimizes financial losses, and ensures safer banking operations.
18. The future of language models is expected to be more advanced, accurate, and context-aware. They will better understand human emotions, tone, and intent, enabling more natural interactions. Integration with multimedia tools will allow models to process text, images, and audio together. Ethical AI development will focus on reducing bias and misinformation. Language models will also become more personalized, adapting to user preferences. However, challenges like data privacy, misuse, and over-dependence must be addressed. Overall, they will play a significant role in education, communication, and content creation.
19. AI plays a vital role in modern media management by automating and optimizing various processes. It helps in content creation, editing, and distribution. AI tools can analyze audience preferences and recommend personalized content. It also assists in managing large media archives through automatic tagging and classification. In newsrooms, AI supports fact-checking and trend analysis. Additionally, AI improves advertising strategies by targeting specific audiences. It enhances efficiency, reduces workload, and enables faster decision-making, making media organizations more productive and competitive.
20. Over-reliance on AI in content creation can lead to several risks. It may reduce human creativity and originality, as AI-generated content often follows patterns. There is also a risk of inaccurate or biased information, as AI depends on training data. Excessive use can result in loss of jobs in creative fields. Additionally, content may lack emotional

depth and authenticity. Ethical concerns such as plagiarism and misinformation can arise. Therefore, while AI is a useful tool, human supervision and creativity remain essential for high-quality content.

21. I text-to-image generation is a technology that creates images based on textual descriptions. It uses deep learning models, especially generative models like GANs or diffusion models. The system is trained on large datasets of images and corresponding text. When a user inputs a description, the AI interprets the text and generates a matching visual output. It works by identifying patterns and relationships between words and images. This technology is widely used in design, advertising, and creative industries for quick and innovative visual content creatio
22. AI-generated images benefit digital marketing by enabling quick and cost-effective content creation. Marketers can generate customized visuals tailored to specific audiences without hiring designers. AI allows for rapid production of ads, social media posts, and promotional materials. It also supports personalization by creating targeted content based on user preferences. Additionally, AI enhances creativity by offering unique and innovative designs. This improves engagement, saves time, and reduces costs, making marketing campaigns more efficient and impactful.
23. AI-driven content creation refers to the use of artificial intelligence tools to generate text, images, audio, or video content. These tools use machine learning and natural language processing to produce content based on user input. AI can assist in writing articles, generating social media posts, creating visuals, and even editing videos. It helps increase productivity, reduce time, and maintain consistency. However, human oversight is important to ensure accuracy, creativity, and ethical standards. AI-driven content creation is widely used in media, marketing, and journalism.

(3x5=15)

Part C

*Answer any **two** questions.*

*Each question carries **10** marks.*

24. Organizations like OpenAI play a crucial role in shaping the future of artificial intelligence through innovation, research, and ethical guidance. These institutions focus on developing advanced AI systems that can perform complex tasks such as natural language understanding, image generation, and decision-making. OpenAI, for example, has contributed significantly through models like GPT, which are widely used in communication, education, and media industries.

    Other organizations such as Google DeepMind, IBM Research, and Microsoft Research also contribute by advancing machine learning, robotics, and data analytics. These organizations invest heavily in developing new algorithms, improving computational

efficiency, and expanding AI applications across sectors like healthcare, finance, and education.

A key role of these institutions is promoting ethical AI development. They work on frameworks to ensure transparency, fairness, and accountability in AI systems. By addressing issues such as bias, privacy, and misuse, they help build public trust in AI technologies. Collaboration between academia, industry, and governments further strengthens research outcomes and accelerates innovation.

Additionally, these organizations support open research and knowledge sharing. Many publish research papers, release open-source tools, and provide platforms for developers worldwide. This democratizes access to AI technology and encourages global participation. OpenAI and similar research organizations are central to the advancement of AI. Their contributions not only drive technological progress but also ensure that AI is developed responsibly, benefiting society as a whole.

25. Generative AI is a type of artificial intelligence that focuses on creating new content such as text, images, audio, and video. Unlike traditional AI systems that analyze data and make predictions, generative AI produces original outputs based on patterns learned from large datasets. Technologies like Generative Adversarial Networks (GANs) and diffusion models enable machines to generate realistic and creative content.

    One of the key features of generative AI is its ability to mimic human creativity. It can write articles, compose music, design graphics, and even create videos. This makes it highly valuable in industries such as media, entertainment, marketing, and education. Tools powered by generative AI are widely used for content creation, automation, and personalization.

    In contrast, other types of AI, such as predictive AI, focus on analyzing existing data to forecast outcomes. For example, predictive AI is used in weather forecasting, recommendation systems, and fraud detection. Similarly, rule-based AI follows predefined instructions and lacks the ability to learn or create new content.

    Another important difference is flexibility. Generative AI models are more adaptable and capable of handling diverse tasks, while traditional AI systems are often designed for specific functions. However, generative AI also raises challenges, including ethical concerns, misinformation, and intellectual property issues. Generative AI represents a significant advancement in artificial intelligence by enabling machines to create content rather than just analyze it. While it differs from other AI types in its creative capabilities, it also requires careful regulation and ethical use.

26. AI-generated video content has gained popularity due to its efficiency and scalability. One major advantage is speed. AI tools can produce videos quickly, saving time and effort compared to traditional methods. They also reduce production costs by eliminating the need for actors, studios, and extensive editing. AI enables personalization by tailoring videos to specific audiences, which is beneficial in marketing and education. Additionally, AI can automate repetitive tasks such as editing, captioning, and voiceovers.

AI-generated videos also have limitations. They often lack emotional depth and creativity, which are essential for storytelling. Human creators bring personal experiences, cultural understanding, and artistic expression that AI cannot fully replicate. AI-generated content may also contain errors, inconsistencies, or unrealistic visuals. Ethical concerns such as deepfakes and misinformation further raise questions about authenticity and trust.

Furthermore, human-created video content offers originality, emotional connection, and authenticity. It is better suited for complex narratives and creative storytelling. However, it is time-consuming, expensive, and requires significant resources. So, both AI-generated and human-created videos have their strengths and weaknesses. While AI enhances efficiency and scalability, human creativity remains irreplaceable. A balanced approach that combines AI tools with human input is the most effective way forward.

27. AI-driven content creation has significantly transformed the media landscape by introducing automation, speed, and personalization. AI tools can generate news articles, social media posts, images, and videos in a fraction of the time required by humans. This has increased productivity in media organizations and enabled real-time content delivery. In traditional publishing, AI assists in editing, proofreading, and content recommendation. It helps publishers analyze reader preferences and deliver personalized content, improving engagement. In broadcasting, AI is used for automated news reporting, voice synthesis, and video editing. It also enables real-time subtitles and translation, making content more accessible to global audiences. However, AI-driven content creation also poses challenges. It may lead to job displacement in journalism and creative fields. There are concerns about misinformation, lack of originality, and ethical issues such as plagiarism. Over-reliance on AI can reduce human creativity and critical thinking. Despite these challenges, AI has opened new opportunities for innovation. It allows smaller organizations to compete by reducing costs and improving efficiency. The future of media lies in integrating AI with human creativity to produce high-quality, reliable, and engaging content. AI-driven content creation is reshaping media by enhancing efficiency and accessibility while also raising important ethical and professional concerns. A balanced and responsible approach is essential for sustainable growth.
