Cooperation**l, 5. **Helping Behavior**. 7. **Generosity**, **3. Compassion**	[An] [3] 4 mark 6 mark
10	Explain the important theories used in pro-social behaviour. **1. Social Exchange Theory- It** posits that human behavior is a result of an exchange process where individuals weigh the costs and benefits of their actions. People engage in pro-social behavior when the benefits (emotional, social, or material rewards) outweigh the costs (time, effort, or resources). **2. Empathy-Altruism Hypothesis-** Proposed by psychologist **Daniel Batson**, the Empathy-Altruism Hypothesis suggests that people help others because they feel empathy for their suffering. The desire to reduce the distress of others motivates helping behavior, independent of any personal gain. **3. Evolutional Psychology Theory - Kin Selection-**Rooted in evolutionary biology, Kin Selection Theory posits that pro-social behavior is more likely to occur toward close relatives, as helping them increases the chances of passing on shared genes. The theory is based on the idea of **inclusive fitness**, meaning individuals help those who share their genetic makeup. **4. Norm of Reciprocity-It** is a social norm that suggests people feel obligated to return favors or help others who have helped them. This norm fosters cooperative behavior and encourages individuals to act in ways that benefit others, knowing that help will likely be reciprocated in the future. **5. Social Learning Theory-** Developed by **Albert Bandura**, Social Learning Theory argues that pro-social behavior is learned through observing and imitating others, especially role models.	[U] [4] 10 mark

	People are more likely to engage in helping behavior if they see others doing the same and receiving positive reinforcement for it. **6. Negative-State Relief Hypothesis: Negative State Relief:** This theory suggests that individuals engage in pro-social behavior to relieve their own negative emotions, such as guilt or sadness. **7. Theory of Planned Behavior-** Proposed by **Icek Ajzen**, this theory suggests that pro-social behavior is influenced by three factors: **attitudes** toward the behavior, **subjective norms** (social pressures to behave in a certain way), and **perceived behavioral control** (the ease or difficulty of performing the behavior). **8. Moral Reasoning and Kohlberg's Stages of Moral Development** According to **Lawrence Kohlberg**, moral reasoning develops in stages, and individuals at higher stages are more likely to engage in pro-social behavior because they adhere to ethical principles and values. Pro-social behavior can be seen as an expression of moral values, such as justice, fairness, and compassion.	
11	Explain the various aspects social exchange with examples. [U] [5] **Social Exchange Theory** suggests that human relationships are formed and maintained based on a cost-benefit analysis, where individuals weigh the potential rewards against the costs of their actions. The theory assumes that people seek to maximize their benefits while minimizing their costs, and that these exchanges are influenced by social norms and expectations. **<u>Various aspects of social exchange:</u>** **1. Costs and Benefits** ○ **Benefits:***Example:* In a friendship, the benefits might include companionship, help in times of need, and a sense of belonging. ○ **Costs:***Example:* A person may feel the cost of a relationship if they have to frequently sacrifice their personal time to help a friend or endure emotional stress in a toxic friendship. **2. Reciprocity-***Example:* If a colleague helps you complete a project, you may feel the obligation to return the favor, such as helping them with a future task or providing assistance in other ways. **3. Equity-***Example:* In a romantic relationship, if one partner feels they are contributing more emotionally, financially, or physically than the other without equal returns, they might feel resentment or frustration. **4. Comparison Level (CL)-** *Example:* If someone has had positive experiences with previous friendships where there was mutual support, they may expect the same level of reciprocity in a new friendship. If the new friendship does not meet these expectations, they might feel dissatisfied. **5. Comparison Level for Alternatives (CLalt)-** *Example:* A person may choose to leave an unsatisfactory job if they believe they can find a better opportunity elsewhere, or a person might end a friendship if they find a new group of people who offer more support or shared interests. **6. Power and Dependence-***Example:* In a workplace, if one employee holds specialized knowledge that another employee depends on, the first employee has more power in their relationship, as the second employee relies on their expertise. **7. Altruism and Self-Interest-**. *Example:* Volunteering at a shelter may not yield direct financial benefits, but the volunteer may gain emotional satisfaction, social recognition, or a sense of community involvement. **8. Social Norms and Expectations-** E*xample:* In many cultures, there is an unspoken expectation that family members support each other during difficult times (e.g., caring for aging parents), which influences behavior even if the individual's personal cost is high. **9. Satisfaction and Commitment-**The **satisfaction** in a relationship is determined by the comparison between the actual rewards and costs versus the expected rewards (comparison level). **Commitment** refers to the willingness of individuals to maintain a relationship over time. *Example:* A couple may feel satisfied in their relationship when they both experience equal efforts and benefits, leading to a long-term commitment to the partnership. .	1 mark 9 mark
